PROFESSIONAL SUMMARY

QA Engineer with 4+ years in web, mobile (iOS/Android), and API testing. I build and maintain UI and API autotests with Playwright (TypeScript) and Node.js, and run them in GitLab CI. I triage failures and keep the suite stable from release to release.

I am the only QA on the product: test strategy, plans, metrics, and documentation in TestRail and YouTrack. Manual coverage includes mobile and API (Postman, Charles Proxy), with SQL checks on data migrations.

I use Cursor agents in that same workflow. They draft Playwright and API tests from tickets, update page objects after UI changes, and give a first read of CI failures. I review every diff before it is merged.

Commercial work covers a dental clinic network, a beauty app, and e-commerce. I have owned QA from zero on a live product, including a React migration.

CORE SKILLS

AI and agents: Cursor Agent, ChatGPT. Test design, first drafts of UI and API autotests, locator and fixture updates, CI log and Playwright trace triage, TestRail drafts. Human review before a change reaches the pipeline.

Test automation: Playwright (TypeScript), Node.js, UI/E2E and API autotests, Git, GitLab CI, flaky-run triage, suite maintenance across releases. Python.

Manual QA: functional, regression, smoke, exploratory; web and mobile (iOS/Android); test design; test plans, checklists, test cases, bug reports.

API and data: REST API, Postman, Swagger, Charles Proxy; SQL (PostgreSQL).

Tools and process: Jira, ClickUp, YouTrack, TestRail, Confluence, BrowserStack, DevTools, Figma, TestFlight.

PROFESSIONAL EXPERIENCE

QA Engineer · White Rainbow (dental clinic network)

May 2023 – Present · Sole QA · Remote

Test automation

- Develop and maintain UI/E2E autotests (Playwright, TypeScript) and API autotests (Node.js) for the main product flows.
- Built the test framework and still own it: repo structure, reusable pieces, and the E2E regression suite.
- Integrated autotests into GitLab CI. They run on push and merge request as part of the release process.
- New E2E and API coverage starts as a Cursor agent draft from the ticket or Figma. I then fix selectors, test data, and assertions, and own the test in GitLab CI.
- After a UI change, the agent updates page objects and fixtures. I rerun the pipeline and keep the suite green.
- On a red pipeline, the agent gives a first read of the CI log and the Playwright trace. I reproduce the failure and decide: product bug or broken test.
- Cut regression time by about 40% by automating the high-risk checks.

Manual QA and quality process

- Set up QA from scratch: strategy, plans, metrics, and documentation.
- Functional and regression testing of the mobile app on iOS and Android.
- Supported the React migration: API integrations, UI against Figma, and SQL checks during the data migration.
- Kept 1000+ test cases and docs current after major architecture changes.
- Work with engineering, analytics, and support through the release cycle.

Key results

- Near-zero post-release defects for 3 consecutive releases, from QA metrics plus CI autotests.
- About 10% team efficiency gain from test documentation that matches the product.
- Full regression coverage and a QA process built from zero on a live product.

QA Engineer · For You (beauty app, startup)
Nov 2022 – Sep 2023 · Remote

- End-to-end manual QA for iOS and Android on real devices, emulators, and TestFlight.
- API testing in Postman and traffic analysis with Charles Proxy.
- Test plans, checklists, and cases. Defects tracked in Jira and ClickUp.
- Release regression and sign-off with engineering before users were affected.

Key results

- 4.7 average app rating on the App Store and Google Play, from release quality and documentation.
- Fewer production defects as the test suite matured.

QA Engineer · Conversion Advocates (A/B testing, e-commerce)
Jul 2021 – Nov 2022 · Remote

- Manual testing in BrowserStack. Defects tracked in Jira.
- API testing with Postman and REST. Root-cause analysis with DevTools.
- Test design and task management in ClickUp.
- Day-to-day work with developers, analysts, and designers.

Key results

- 3% fewer production defects and 5% fewer negative client escalations, from checklists and test cases.

SELECTED PROJECTS

My own products, separate from commercial QA work. Built and checked with Cursor agents.

EnglishPath — live English-learning site. Lessons by level, accounts, an admin lesson builder, and a Stripe subscription. HTML, JavaScript, Supabase, Stripe, Vercel. Unit checks cover the exercise checker: gaps, choices, and one-time answers.
english-path-mauve.vercel.app · github.com/Arttatan/englishpath

Group messenger — live mobile web chat for a private group. Firebase Auth and Realtime Database: messages, images, typing, and presence. HTML, JavaScript, GitHub Pages.

CAREER HIGHLIGHTS

- Critical autotests run in GitLab CI before every production release. I review agent drafts before they merge.
- QA on the clinic product was built from zero: strategy, documentation, and the automated regression.

EDUCATION

St. Petersburg Mining University — Engineering

Certifications and courses: ProductStar — Test Automation (2022–2023) · QA Tester Professional (2021) · Netology — HTML/CSS (2021)

Languages: English — professional working proficiency (documentation, async communication, calls) · Russian — native
